Every part, verified to fit

One verified catalog for Indonesia's $5.3B auto industry — brands, distributors, stores, mechanics and drivers on the same fitment data, which we had to assemble ourselves because nobody else has it.

THE PROBLEM

Buying car parts online is a guessing game

19.4%

OF PARTS SOLD ONLINE COME BACK.
86% OF THEM ARE THE WRONG FIT.

Every part on a car has exactly one match: one year, one trim, one engine. The buyer cannot check which one they are looking at. The seller cannot check either, so the two of them settle it over WhatsApp and hope. The platform takes 17 to 20 cents of every rupiah regardless of how that turns out.

> "People are afraid to buy expensive things on Tokopedia because they don't know what they'll get."
>
> Parts buyer, Atrium Plaza Senen, June 2026

Sources. 19.4% return rate — ServeRetail. 86% of returns fitment-driven — Alhena AI. The 17–20% commission figure is what sellers told us in our own June 2026 survey; see slide 4.

THE BUYER

Buyers cannot tell what fits

Parts are cheap and there are plenty of them. What is missing is any way to know, before paying, that the thing in the listing will bolt onto your car.

The wrong part arrives

A listing gives you a part number and a photo. Neither one tells you which of the eleven variants of a model year you are looking at, and an Avanza is not one car.

Original or copy

In a photo, a copy and an original look the same. Verified has to mean two things at once: it fits your car, and it is the real part.

No guidance, only volume

So buyers look up chassis codes themselves and ask sellers who are also guessing. More listings does not produce a better answer, and after a certain point it produces a worse one.

19.4% INDUSTRY RETURN RATE	**86%** OF RETURNS ARE FITMENT ERRORS	**<2%** OUR TARGET ONCE FITMENT IS ENFORCED

> "I WhatsApp sellers asking if a part fits my car. We both guess. Sometimes we're wrong."
>
> Car owner, Jakarta, June 2026

Sources. Return rate — ServeRetail; fitment share — Alhena AI. The sub-2% figure is our own target, derived from the ~30% reduction reported after fitment enforcement (X-Cart).

THE SELLER

What is closing shops

We asked sixty shop owners what was actually hurting. Three answers came back, and none of them were about demand.

COMMISSION

A fifth of the sale, before costs

Automotive commission went up, and the default fees stack on top of it. Parts margins do not absorb that.

COD RETURNS

A wrong part ships twice

2× OUT TO THE BUYER, AND BACK AGAIN, UNPAID

Indonesia's parts trade runs on cash on delivery, so a part that does not fit is refused at the door. The shop pays the shipping both ways and the car is still up on the lift. Some boxes come back with stones in them. Then the platform records the return against the shop.

> "My shop was closed because of too many returns from COD. The platform penalized me. Not the customer."
>
> Shop owner, Atrium Plaza Senen

GETTING ONLINE

Typing in the catalog by hand

There is no bulk route in. Owners spend days entering product data instead of running the shop, and a lot of them stop partway.

> "It would make me dizzy to do it manually. I have over 3,000 SKUs."
>
> Shop owner, Pusat Onderdil Pondok Cabe

Sources. The 17–20% all-in commission figure comes from our own survey of 60 shops across three Jakarta markets in June 2026, not from a published policy document. Tokopedia's base commission schedule is published here and its dynamic component here; the all-in number sellers report includes fees those pages do not aggregate. Quotations translated from Indonesian.

WHY THE GAP EXISTS

Four hard things had to come first

None of them produce anything sellable on their own, and a platform selling phones and shoes alongside brake pads never had a reason to build any of them.

01 A vehicle database

Nobody had assembled coverage of the Indonesian car parc five levels deep, down to trim and engine. Ours came to 5,924 variants across 71 makes, and most of that work was reconciliation.

02 Fitment as a relationship

A marketplace models a brake disc the way it models a t-shirt: a title, a price, a size field. Fitment is not an attribute of a part.

03 A way in for the catalog

Someone who has run a parts counter for twenty years should not have to become a data-entry clerk to sell online.

04 Disputes someone reads

Resolution defaults to the buyer because that is cheaper to operate. Investigating properly costs money.

> We built for the shops that have been here longest — the ones with a name, a counter and a customer list, and no infrastructure to match.

WHAT WE BUILT

Five pieces, none of them available off the shelf

THE CORE

The fitment graph

191,646 records tying parts to the exact vehicles they fit, across 5,924 variants and 71 makes. There is no dataset to buy for this market, so it came out of OE data, registry reconciliation, and corrections fed back from confirmed fits.

COMPUTED

Fitment from geometry

For wheels and tires, fit is calculated from bolt pattern, hub bore, offset and overall diameter within a 3% tolerance, and a missing hard dimension fails closed to no fit. A scraped compatibility table carries somebody else's verdict without the measurements behind it.

GATED

An importer that checks its input

A seller's CSV clears four gates before anything publishes: template completeness, spec plausibility, a cross-check of the claimed bolt pattern against our own factory spec, and duplicate detection. What comes out is one verified listing per part, no matter who described it, enforced by the schema rather than by moderators. Ambiguous rows go to a person.

99.5% COVERED

Our own OE specifications

Factory specs for the cars actually on Indonesian roads. 5,894 of 5,924 vehicles carry at least one spec row, and 7,088 verified specs sit behind a CI check that only lets the count grow. ACES covers the Americas; TecDoc has not reached Indonesia.

RUNNING

A correction loop

Confirmed fits feed back as evidence, so the data improves while the marketplace is used.

HOW LONG TO REBUILD

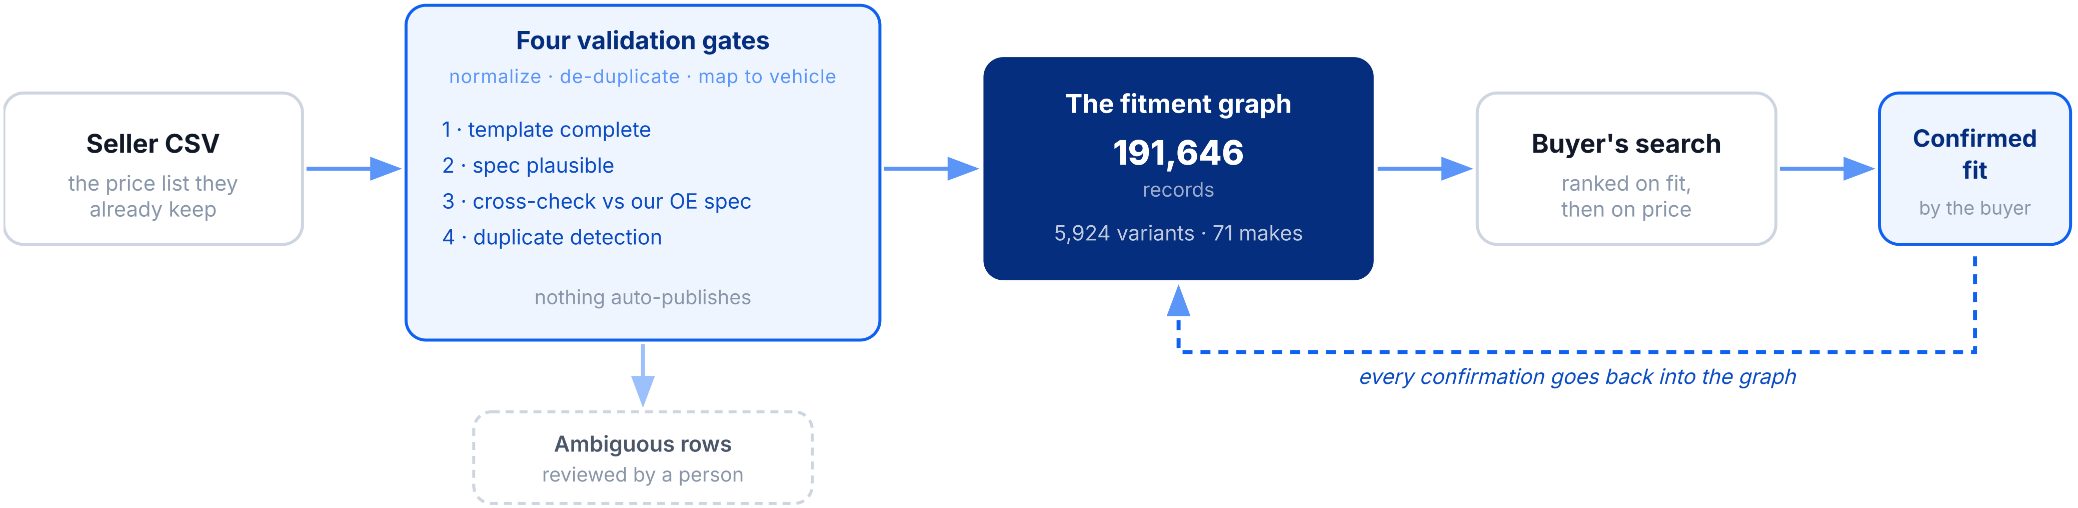
Roughly **18 months** for the software. Three to five years for the data, and it keeps moving while you build it.

Our estimate, from what it took us.

Provenance. Vehicle, make and OE-spec counts are from a committed snapshot of the production database dated 28 June 2026; the 191,646 fitment records are a live count taken 18 July 2026. The 7,088 verified specs are enforced by a continuous-integration check. Roughly 573 rim rows originate from a third-party reference site rather than our own extraction, and we are purging them.

HOW IT WORKS

From a seller's spreadsheet to a verified fit



RANKS FIRST

Search orders results by how well a part fits the buyer's car, and only then by price. Sellers compete on being right.

ON A MISMATCH

Verified fits are labeled as verified. A mismatch warns the buyer and makes them override it deliberately. We do not claim to be right every time.

NOT BUILT YET

Excel and PDF price lists. Today the importer takes CSV, a URL, or a Shopify export.

THE BUYER'S JOURNEY

What buying a part looks like

01

Select your vehicle

Five levels, down to trim and engine. It stays in your garage.

02

Search against it

Verified fits come first and are labeled. Anything doubtful says so.

03

Protected on both sides

Funds are held 48 hours past delivery before the seller is paid.

04

Disputes have a clock

A claim opens an eleven-state process with a 72-hour response window.

One thing we will not claim: that a wrong part can never reach a buyer. It can. What changes is that the platform knows the fit was doubtful, said so before the sale, and has an escrow window and a dispute clock behind it when something goes wrong.

THE SELLER'S SIDE

What selling on Mobeeli looks like

FEES

Three months at nothing, then it scales

The first 300 shops into the Early Adopters Program pay no commission for three months. After that the rate climbs with the shop's own volume and stops at 5%.

A shop turning over **Rp 200 million a month** pays roughly Rp 35 million in commission today. Here that is nothing for three months, then about Rp 10 million once the rate reaches the cap.

GETTING LISTED

Your catalog, imported

Send the CSV you already keep. It is read, checked against four gates and mapped into the fitment graph, and the shop is live in hours rather than weeks.

DISPUTES

Someone reads the evidence

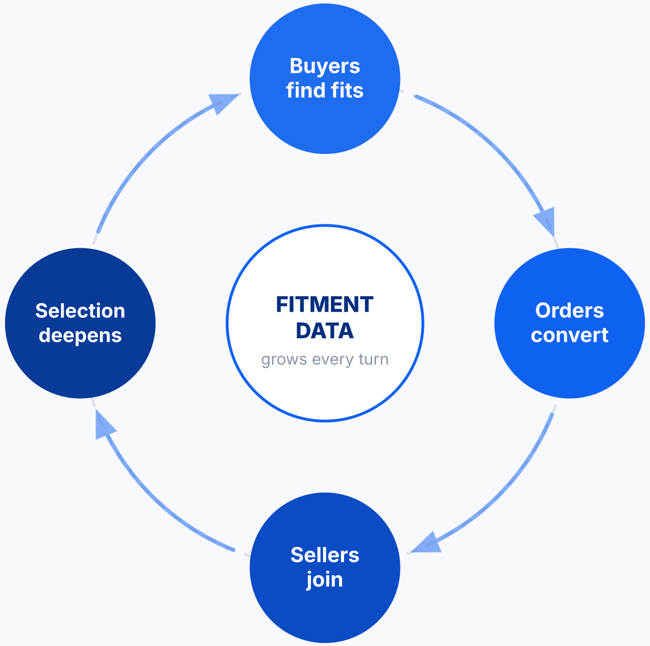
Claims run on a clock with packing and delivery evidence attached, and a seller who did the right thing is not automatically the one who pays. A seller misrepresenting a copy as genuine escalates straight out of the queue.

> "We want to be fair. If someone cheats, they won't last."
>
> Mobeeli, on the dispute policy

Sources. The Rp 200M example uses the 17.5% midpoint of the all-in commission sellers reported to us in June 2026. Fee ladder, cohort seats and the 48-hour escrow window are as implemented in the platform's fee resolver and order state machine.

NETWORK EFFECTS

Why this compounds



The loop itself is ordinary marketplace mechanics. The hub is not: every turn of it deposits fitment data, and that is the asset.

Sellers compete on accuracy

On a generalist platform the way to win a listing is to be cheapest. Here it is to be right, which is a different business to run and attracts a different kind of shop.

The data pays twice

Confirmed fits and supplier catalogs both improve the graph, which improves the next search.

Workshops are sticky

A mechanic with a supplier list and a vehicle garage on the platform has to rebuild both to leave.

FIELD RESEARCH

We spent June in three Jakarta parts markets

Sixty shops, in person, at Atrium Plaza Senen, Pusat Onderdil Pondok Cabe and MGK Mega Glodok Kemayoran. We went to test whether the commission problem was as bad as we thought.

What we expected

Commission, and that is what we got. It came up unprompted in almost every conversation, and several owners had the arithmetic ready before we asked.

What we did not expect

Most shops already selling online are run by younger owners. The reason the others gave was not reluctance. Getting a catalog online is genuinely hard the first time, and nobody had made it easier. Several asked when we were launching before we had finished explaining the product.

"I had a Shopee order today. I worked out my price and I would lose money on it. I cancelled it."

Wholesaler, MGK Mega Glodok Kemayoran

"It would make me dizzy to do it manually. I have over 3,000 SKUs."

Shop owner, Pusat Onderdil Pondok Cabe

"My shop was closed because of too many returns from COD. The platform penalized me. Not the customer."

Shop owner, Atrium Plaza Senen

Method. Sixty shops approached in person during June 2026 across the three markets named above. Quotations are translated from Indonesian. The 3,000-SKU figure is one owner's account of his own shop, not a survey average.

We pitched fitment. They answered price.

Twenty-three booth conversations at GIIAS, on 30 July and 1 August. Manufacturers and distributors this time rather than shops.

They answered price

Four of the five counterparties on the first day named price erosion as their number one pain, unprompted. The mechanism is stock dumping: a large store buys enough volume to earn the distributor price, then sells below list to rotate its capital. Fitment landed as useful. Holding a price floor landed as urgent.

And duplicate listings

Four brands raised it independently. One SKU carrying more than a hundred listings, splitting its reviews and burying the official source.

Both answers need the same thing: one listing per part, with the brand holding authority over it. That is the structure the fitment graph already requires. We had simply not been leading with it.

> "Our biggest frustration is agents killing each other on price. We currently have to manually monitor platforms and report violators to get them banned."
>
> Head-unit distributor, GIIAS 2026

WHAT WE CAME AWAY WITH

Twenty-two threads still open

The useful part is who they were. A shop brings one catalog; the distributors and manufacturers here each bring several brands and tens of thousands of parts. Every ask came from their side of the table, and two of the rooms turned into investor conversations rather than customer ones.

Method. GIIAS 2026 at ICE BSD, Tangerang. Five booth conversations on 30 July and eighteen on 1 August; we were not on the floor for the remaining days. Counterparties are described by category rather than named.

PRE-LAUNCH DEMAND

38 of them signed up

38

OF THE 60 SHOPS WE PITCHED, OR 63%

We had no live product to show them. A conversation, the fee terms in writing, an explanation of fitment and the importer, and nothing else on the table.

WHAT IT TELLS US

- The commission increase is recent, and it is the trigger
- Nobody needed persuading that the problem is real
- Several asked for a launch date on the spot

WHAT IT DOES NOT

- 38 signatures, no revenue
- No live merchants and no GMV yet
- A waiting list converts at some rate we have not measured

Method. Sixty shops approached in person across three Jakarta markets during June 2026; 38 joined the pre-launch list. Status as of August 2026: pre-launch, no live merchants, no GMV.

BUSINESS MODEL

One revenue line at launch, four behind it

The transaction fee is built, tested and carries the plan on its own. The other four are real businesses on this infrastructure and none of them is written yet.

LIVE AND TESTED

Transaction fee, capped at 5%

Charged on completed orders. Buyer funds sit in escrow until 48 hours past delivery. Early cohorts start at nothing and climb through 2, 3 and 4% to the cap, and the resolver falls back to the full rate rather than to zero if anything is misconfigured.

PLANNED

Logistics margin

Around 1.2% on shipping through integrated partners, heavy cargo included. The admin control exists, defaults to zero, and nothing reads it yet.

PLANNED

Seller software

Stock, pricing and analytics for high-volume shops. A tier flag exists in the schema with no billing behind it.

PLANNED

Sponsored placement

Brands paying for position. Needs real search traffic first, so year two at the earliest.

PLANNED

Embedded insurance

Shipping and authenticity cover on high-value orders, split with an underwriter we have not signed.

WHAT A SELLER PAYS IN TOTAL

Today, all-in — 17–20%

Mobeeli, blended over the first 18 months — ~4.8%

The blended figure includes the ramp from 0% to 5%, which is why it lands under the cap. At steady state on a Rp 2.5M average order, commission plus the planned logistics margin would come to about 6.2% of order value.

Sources. Fee rates, the 5% cap, the graduation ladder and the 48-hour escrow window are as implemented. Build status for each line above reflects our own feature register as of August 2026. The 17–20% comparison is from our June 2026 seller survey.

FEES

How a shop goes from 0% to 5%

Three months free for everyone. After that the rate starts when the shop has the volume to carry it, or at month six, whichever comes first.

3	→	GMV	→	5%
months at 0%		or month 6		capped rate
EVERY SHOP		WHICHEVER FIRST		VS 17-20% TODAY

TIER 1 · ANCHORS · 30 SEATS

Top wholesalers

- 0% until cumulative GMV of Rp 500M
- From month 6, 2% rising a point a month to the cap
- Advisory input and featured placement

TIER 2 · EARLY ADOPTERS · 270 SEATS

The core marketplace

- 0% until cumulative GMV of Rp 20M
- Same ramp from month 6
- Priority support and early access

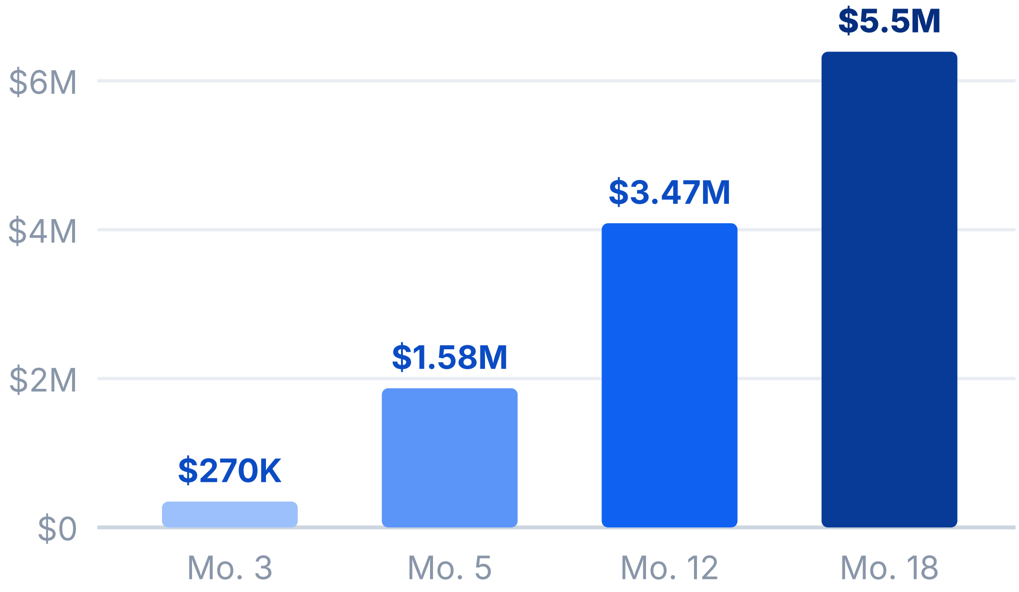
High-volume shops start contributing sooner because they cross the GMV line sooner. Low-volume shops still start at month six. The reason for two thresholds rather than one is that Rp 500M and Rp 20M are roughly the same month of trading for the two kinds of shop.

Sources. Cohort seats (30 anchor, 270 early, growth pricing from the 301st shop) and the 0 → 2 → 3 → 4 → 5% ladder with a 5% cap are as configured in the platform's fee settings.

REVENUE

What 300 shops on that ladder produce

ARR BY MONTH, BASE CASE



THREE WAYS IT COULD GO, AT MONTH 18

CASE	ARR	18-MO
Low	$3.2M	$2.1M
Base	$5.5M	$3.8M
High	$7.9M	$5.8M

The low case still reaches a Series A. That is the number we plan against.

Assumptions. The base case takes 50% penetration of anchor GMV, 75–80% of the growth-tier acquisition target, and two full-time salespeople from month one. The high case assumes anchors move volume onto the platform faster than planned. All three are our projections and none is a commitment. An earlier internal model built on different assumptions produces materially lower figures; we are happy to walk through both.

COMPETITION

Built for automotive. Not bolted on.

	TOKOPEDIA / SHOPEE	MOBEELI
Fitment data	✕ None	✓ 191,646 records
Search ranking	✕ Price first	✓ Fit first, then price
Return disputes	✕ Default to the buyer	✓ 72-hour clock, evidence attached
Getting a catalog online	✕ Typed in by hand	✓ CSV through four gates
Original vs copy	✕ Unmarked	✓ Three-tier label on every listing
Seller commission	✕ 17–20% all-in	✓ 0% rising to 5%

THE DATA

191,646 records need OE data, registry reconciliation and live corrections. Three to five years.

THE INTEGRATION

Fitment, escrow, importer and logistics all have to agree with each other. Around 18 months of engineering.

THE RELATIONSHIPS

A workshop with its suppliers and its garage here has to rebuild both to leave.

Note. Competitor rows are our own feature review of both platforms, June 2026 — observed behavior, not disclosed roadmap. Commission figures for both sides are described on slides 4 and 14.

TEAM

Who is building it

Yavet Arimathea Widjaja

Chief Executive · Founder

A lifetime in Canada, a career across automotive and tech e-commerce: he saw the gap in Indonesia's parts trade and came home to close it.

Muhammad Salman Al Hafizh

Chief Technology · Co-founder

Built the platform before there was any funding: the fitment graph, the gated importer, the escrow and the marketplace.

Ferdinansyah Husein

Chief Operating · Co-founder

Operations and partnerships: logistics, payments and the wholesaler pipeline that feeds the anchor tier.

The three of us have been full-time on this without salaries. The product was built before we asked anyone for money, and the fitment graph exists because we sat down and built it rather than waiting for a round to make it someone else's job.

THE ASK

$500,000

for 10%
$5M post-money
18 months of runway

01 **300 shops trading** — 30 anchor wholesalers and 270 on the early tier

02 **$5.5M ARR at month 18** — base case, against a $3.2M floor

03 **$3.8M booked** — cumulative over the 18 months

04 **Series A ready** — positioned to raise $3–8M at the end of it

Where it goes

- Engineering from three people to eight
- Two full-time salespeople from month one
- Going to market in Jakarta through 2026
- Payment and logistics integrations
- Excel and PDF import, and the rest of the importer roadmap

Why now

- The commission increase landed this year and shops are looking
- 191,646 fitment records already exist and nobody else is building them
- The product is built, so this buys distribution rather than a prototype
- 38 shops are waiting for a launch date

WHERE IT GOES

Fitment is the wedge

Prove it in Indonesia, go deep before going wide, then run the same playbook across Southeast Asia. The fragmentation is regional and so is the missing fitment layer.

NOW TO MONTH 18

Prove it in Jakarta

300 shops on the graduated fee, in the largest and most fragmented market in the region. The playbook gets written in the hardest place.

AFTER THE SERIES A

National coverage

More categories, then island by island: from Sabang to Merauke, one catalog. The workshop network gets more valuable as it fills in.

THE OUTCOME WE WANT

Regional consolidation

A private-equity buyout takes the Indonesian playbook country by country. The earlier and smaller version of this is a group like Astra or GoTo buying the fitment layer to fix a problem it already has.

$300M+

WHAT WE ARE WORKING TOWARDS

Astra and GoTo are named as plausible acquirers, not partners, and neither has been approached. The $300M figure is our ambition rather than a forecast.

One platform to unify Indonesia's auto industry
